Protein Function Prediction For Omics Era:

Protein Function Prediction for Omics Era Daisuke Kihara, 2011-04-19 Gene function annotation has been a central question in molecular biology. The importance of computational function prediction is increasing because more and more large scale biological data including genome sequences, protein structures, protein-protein interaction data, microarray expression data, and mass spectrometry data are awaiting biological interpretation. Traditionally, when a genome is sequenced, function annotation of genes is done by homology search methods such as BLAST or FASTA. However, since these methods are developed before the genomics era, conventional use of them is not necessarily most suitable for analyzing a large scale data. Therefore, we observe emerging development of computational gene function prediction methods which are targeted to analyze large scale data and also those which use such omics data as additional source of function prediction. In this book, we overview this emerging exciting field. The authors have been selected from 1) those who develop novel purely computational methods, 2) those who develop function prediction methods which use omics data, 3) those who maintain and update data base of function annotation of particular model organisms. *E. coli* which are frequently referred.

Analyzing Network Data in Biology and Medicine Nataša Pržulj, 2019-03-28 The increased and widespread availability of large network data resources in recent years has resulted in a growing need for effective methods for their analysis. The challenge is to detect patterns that provide a better understanding of the data. However, this is not a straightforward task because of the size of the data sets and the computer power required for the analysis. The solution is to devise methods for approximately answering the questions posed, and these methods will vary depending on the data sets under scrutiny. This cutting edge text introduces biological concepts and biotechnologies producing the data, graph and network theory, cluster analysis, and machine learning, before discussing the thought processes and creativity involved in the analysis of large scale biological and medical data sets using a wide range of real life examples. Bringing together leading experts, this text provides an ideal introduction to and insight into the interdisciplinary field of network data analysis in biomedicine.
