Molecular Basis of Viral and Microbial Pathogenesis Rudolf Rott, Werner Goebel, 2012-12-06 Elucidation of the mechanisms of pathogenesis underlying the diseases caused by viruses and bacteria has fascinated scientists for many years in two ways Firstly these pathogenic agents represent relatively simple biological systems for the study of basic biological processes such as replication gene regulation genetic variability and host pathogen interactions Secondly process in this field is valuable in a practical sense since it can help in the control of these diseases The availability of new genetic and immunological techniques especially recombinant DNA methods and monoclonal antibody technology has provided powerful tools for unravelling the genetic biochemical and immunological basis of viral and microbial pathogenesis Molecular cloning has allowed the isolation of single genes or groups of genes related to phenotypes which appear to be immunologically important for pathogenesis The specific elimination of such genes from the complex genomes of the pathogens can now be achieved with similar genetic techniques These genetic studies have provided additional information on the role played by specific phenotypic traits in pathogenesis especially when combined with relevant animal model systems Furthermore the structural analysis of important virulence factors and surface antigens may allow the prediction of antigenic domains suitable for the development of new vaccines The 38th Mosbacher Colloquium focuses on the molecular basis of viral and microbial pathogenesis The virology part begins with the well studied plant viroids The unusual structure of their genome as well as knowledge about their replication and pathogenicity are presented *Rapid Methods and Automation in Microbiology and Immunology* K.-O. Habermehl, 2012-12-06 Rapid progress in molecular biology genetic engineering and basic research in immunology has opened up new possibilities for application to diagnostic procedures and to clinical research In a short period a new era of diagnosis dawned covering nearly all fields of microbiology immunology and food technology In consequence of this rapid development scientists of many disciplines are involved studying infections of humans animals and plants or working in technical microbiology The application of the newest findings of basic research to diagnostic work and to clinical research covers nearly all fields of microbiology and immunology Moreover it underlines the close relationship between diagnosis therapy and epidemiology An outstanding example of these connections is given by the recent development of hepatitis B vaccine The discovery and identification of a non cultivable agent by physicochemical and immunological methods were the heralds of a new era in the prevention of infectious diseases This book provides an up to date comprehensive review of developments and future aspects in various fields I am convinced that the authors have succeeded in furnishing a large variety of new ideas and possibilities K O HABERMEHL Contents Time Realities in the Evaluation of Vaccines for Safety and Efficacy The Evaluation of Vaccines M R HILLEMANN **Rapid Detection and Identification of Infectious Agents** David Kingsbury, 2012-12-02 Rapid Detection and Identification of Infectious Agents is a collection of papers presented at the International Symposium on Rapid Detection and Identification of Infectious Agents
